QuestionAnswer What are the common types of asbestos found in occupational health exams? The common types of asbestos include chrysotile (white asbestos), amosite (brown asbestos), crocidolite (blue asbestos), tremolite, anthophyllite, and actinolite. Occupational health exams often

focus on exposure to these types, especially chrysotile and amosite. What are the primary health risks associated with asbestos exposure? Asbestos exposure is primarily linked to respiratory diseases such as asbestosis, lung cancer, and mesothelioma. Long-term exposure can lead to serious, often fatal, health conditions affecting the lungs and pleural lining. How is asbestos exposure typically assessed in OH exams? Assessment involves detailed occupational history, environmental exposure evaluation, chest X-rays, lung function tests, and sometimes biomarker analysis to detect asbestos fibers in the lungs or bodily fluids. What personal protective equipment (PPE) is recommended during asbestos removal? PPE includes respiratory masks (such as P100 or HEPA filters), disposable coveralls, gloves, and eye protection to prevent inhalation or contact with asbestos fibers during removal activities. What legal regulations govern asbestos testing and abatement in occupational settings? Regulations such as OSHA standards in the US, HSE guidelines in the UK, and other local regulatory bodies set strict protocols for asbestos testing, handling, and removal to ensure worker safety and environmental protection. What are the signs and symptoms to watch for in asbestos-exposed workers during an OH exam? Symptoms may include persistent cough, chest pain, shortness of breath, and fatigue. However, early stages are often asymptomatic, emphasizing the importance of regular screening and imaging. How often should workers exposed to asbestos undergo medical examinations? Sample Questions and Model Answers

To illustrate, here are some representative questions with detailed explanations:

Question 1: Which of the following materials is considered friable asbestos?

- a) Vinyl flooring
- b) Spray-applied insulation
- c) Cement pipes
- d) Asphalt shingles

Correct Answer: b) Spray-applied insulation

Explanation: Friable asbestos materials are those easily crumbled or reduced to powder by hand pressure. Spray-on insulation is a classic example of friable ACM, posing higher inhalation risks if disturbed. Cement pipes and vinyl flooring typically contain non-friable asbestos, which is less likely to release fibers unless damaged.

Question 2: According to OSHA regulations, what is the minimum respiratory protection level required during asbestos abatement activities?

- a) Dust mask (NIOSH N95)
- b) Half-face elastomeric respirator with HEPA filters
- c) Full-face positive-pressure supplied-air respirator
- d) Surgical mask

Correct Answer: c) Full-face positive-pressure supplied-air respirator

Explanation: OSHA mandates the use of high-level respiratory protection, such as supplied-air respirators, during asbestos removal, especially in high-risk situations. N95 masks are inadequate for asbestos due to their limited filtration capacity. Full-face respirators with HEPA filters are also acceptable but may be insufficient without positive-pressure systems in high-exposure scenarios.

Question 3: In the event of accidental disturbance of asbestos-containing material, what is the immediate action to take?

- a) Continue work and monitor the area
- b) Stop work immediately, evacuate the area, and inform the supervisor
- c) Cover the disturbed area with plastic sheeting and proceed
- d) Dust the area to settle fibers

Correct Answer: b) Stop work immediately, evacuate the area, and inform the supervisor

Explanation: Disturbing ACM can release hazardous fibers. Immediate evacuation and notification ensure that proper containment, cleanup, and assessment can occur, minimizing exposure risk.
